You maybe right, but we are going to try on the basis that it is in a precarious position until we get cement across it. What is the downside for the MMS to do this for safe ops.

Best Regards,
Brett

We're working it. Scherie will inform them we can't do what they are asking. If necessary, we will have a conference call. We should be able to get an BOP extension until we finish killing well and set 1 cement plug.

Best Regards,
Brett

What is the requirement for a hydrocarbon zone? we have a 5' stringer that shows resistivity.

This is below the under reamer, so we cannot perforate to put cement across this zone.

John/Brian,

Frank sent me an email asking if there are any hydrocarbon bearing zones below 12,900'.

He also returned the permit with these comments:

Errors & Comments:

NOTES: Before step 15 the BOP's should be tested. If there are HC zones below the plug they should have cement across them by perfring the DC's.

Status

So - he is basically saying we have to test BOPs after killing the well.

I can find out if David Trocquet is in the office and set up a call to him to discuss - Frank does not have the authority to grant an extension past killing the well. Let me know.
