Subject: Top kill and pressure  
Importance: Normal

Trevor,

Can we have a chat in the morning about the top kill data? It has been annoying me for a little while and I couldn't work out why. I had another look tonight and I have convinced myself that it was always doomed to failure. The upside is that I don't think we could get enough mud into the well to kill it so think that the well is not been damaged. I appreciate that you have probably been through all this and I will be covering old ground but.....

It also has implications for the inspection. I think we already have all the data we need and we won't get much more in the next few days. Simon et al have explained what you were after but I think we have these answers already. I am not convinced that we have looked at the data already in thoroughly enough or through the right lens.

Tom
