Proposed content for pressure-flow information review meeting

Purpose

To review at an overview level the information available within BP as related to understanding of pressure-flow behaviour of the MC252 system - data, assumptions, methodologies, tools.

To check whether further detail on any of these aspects would be of assistance to National Lab staff in their work for Secretary Chu, and if so to set up meetings between the relevant groups.

Information for review

- MC252 fluid properties and flow conditions
- Modelling of two-phase flow
- Measurement of two-phase flow
- Units of measurement and conversion to standard conditions
- Design flow measurements - RITT, Enterprise, Q4000
- Flow path scenarios including subsurface constraints
- Need to better support operational decisions on dynamic kill and cap capabilities for containment?
